TOPIC -----

I'm working with Aristotle on an Apple IIGS school network and have 150 applications listed in our current menu. The Apple IIGS teacher workstation has 2MB of RAM installed.

I want to add additional applications to the network, but run up against the 150 limit. How can I create an additional menu while continuing to work under "Administrator"?

DISCUSSION -----

The Aristotle user manual has a 256K RAM card/cache set for initial setup. By increasing the amount of RAM card/cache, you should be able to exceed the 150 barrier that you encountered. The Users, Teachers and menu information are loaded into the RAM card/cache when you log on to the server.
