DOS: Version 3.3 and the language card

==

At power up, DOS 3.3 looks at location $E000, both on the motherboard and
on the firmware card, to check which version of BASIC is available. If a
Language card is present, DOS tries to jump into some random information on
the card. This jump is prevented by a machinge language routine that places
a $00 at $E000 on the Language card during booting. This routine is stored
on the DOS diskette at track 0, sector 9, starting at byte $D3
