AppleTerm: Using it with a IIc or IIe

==

If the AppleTerm program refuses to address a modem when a printer is attached
to another port or card, check that the printer is turned on and selected. If
so, everything should work right. If the printer isn't turned on or selected,
and is yet still connected to the port or card, then the modem won't work: the
program sends an initialization procedure to the printer, and if it doesn't get
something back from the printer firmware, it will hang. Usually what happens is
that a "@" appears in the upper left corner of the screen.

NOTE: This same problem will occur if the printer interface isn't on an Apple
      Super Serial Card: AppleTerm will only acknowledge an Apple SSC.
