AppleSoft: INPUT Statement Documentation Error

===

The 'BASIC Programming with ProDOS' manual, published by Addison-Wesley,
(service part number 030-1119) has an Appendix B which, among other things,
lists changes made to AppleSoft. On page 218, the manual has inaccurate
information concerning changes made to the AppleSoft INPUT statement:

"The AppleSoft INPUT command has been made more useful. This command always
reads an entire line of text from a file. As before, multiple variables in an
INPUT statement are assigned strings of characters that are separated by
commas in the input string. When you use ProDOS, the last variable in the
INPUT list is assigned all the remaining characters in the line, including
commas and colons. This means that you can now use a single INPUT statement,
such as 10 INPUT XX$, to read any arbitrary string of characters."

This paragraph is incorrect. The feature mentioned was considered but not
implemented due to compatibility problems.
