Enhanced Apple IIe: MouseText Problem Solved By AppleWorks V2.0

===

This article last reviewed: 30 March 1988

Some users have asked about a version of AppleWriter for the enhanced
Apple IIe, since there are conflicts with the enhanced Apple IIe's MouseText
function (you can tell if the computer is enhanced if it displays "Apple //e"
rather than "Apple][" on the screen at startup).

AppleWriter 2.0, ProDOS version, resolved this problem for the enhanced
Apple IIe, but is no longer on the price list.

If you don't have this version, you may use an alternate word processing
program. One such program that does not conflict with MouseText is
AppleWorks 2.0.
