Apple IIGS: Getting the LaserWriter to Emulate an Epson Printer

=====

This article last reviewed: 11 September 1987

It is possible for the LaserWriter to emulate an Epson printer. The easiest way to do this is to modify the IWEM file on the Apple IIGS System disk. IWEM is simply a text file with PostScript commands that emulate the ImageWriter commands. If you are familiar with writing in PostScript, then you can change which control codes are recognized and what they do.
